**LONG-TERM HEALTH OUTCOME AMONG
HCV PATIENTS WITH ADVANCED LIVER
FIBROSIS TREATED THROUGH THE HCV
ELIMINATION PROGRAM**

Maia Kajaia, MD, MS
Health Research Union

Goal

- Evaluation of long-term treatment outcome among patients with advanced liver fibrosis treated with DAAs after achieving sustained viral response (SVR)

Objectives

- Follow a cohort of HCV-infected persons with advanced liver fibrosis enrolled in HCV Elimination Program to estimate:
 - Changes in liver fibrosis level
 - Changes in liver enzymes and PLT
 - The risk of decompensated liver cirrhosis

Participating clinics

- Neolab
- Infectious diseases clinic
- Hepa
- Mrcheveli

Methods

- Study cohort included patients who:
 - Completed full course of the DAA treatment through HCV elimination program in Georgia
 - Had advanced liver fibrosis level by elastography ($\geq F3$) or FIB4 score (≥ 3.25)
 - Achieved SVR (measured at week 12-24 post treatment)

Methods

- Study cohort selected from patients enrolled in HCV elimination program in May-December, 2015
- First follow-up visits performed from Nov 2017 – June 2018 (~2 years after SVR achieved)
- Second follow-up visits started from May 2019 (~4 years after SVR achieved)
- Baseline data: extracted from medical records
- Follow-up data: prospectively collected

Methods

- Baseline and post treatment changes were evaluated:
 - Liver fibrosis level (in kpa or FIB4 score)
 - ALT
 - AST
 - PLTs
 - Spleen size
 - Presence of ascites

Results

Totally 600 patients had the first follow-up visit (2 years after achieving SVR)

Demographic characteristics of the sample

Characteristic	N	%
Age		
18 – 49	250	41.7
≥ 50	350	58.3
Gender		
Female	85	14.2
Male	515	85.8

Results

- Up to date 227 patients had second follow-up visit (4 years after achieving SVR)
- Mean age 51.9 (range 27-77 years)
- Males 84.6%

Results

Baseline clinical characteristics of the sample

Characteristic	N	%
Liver fibrosis		
F3	80	13.3
F4	450	75.0
Ascites		
Present	17	2.8
Not present	583	97.2

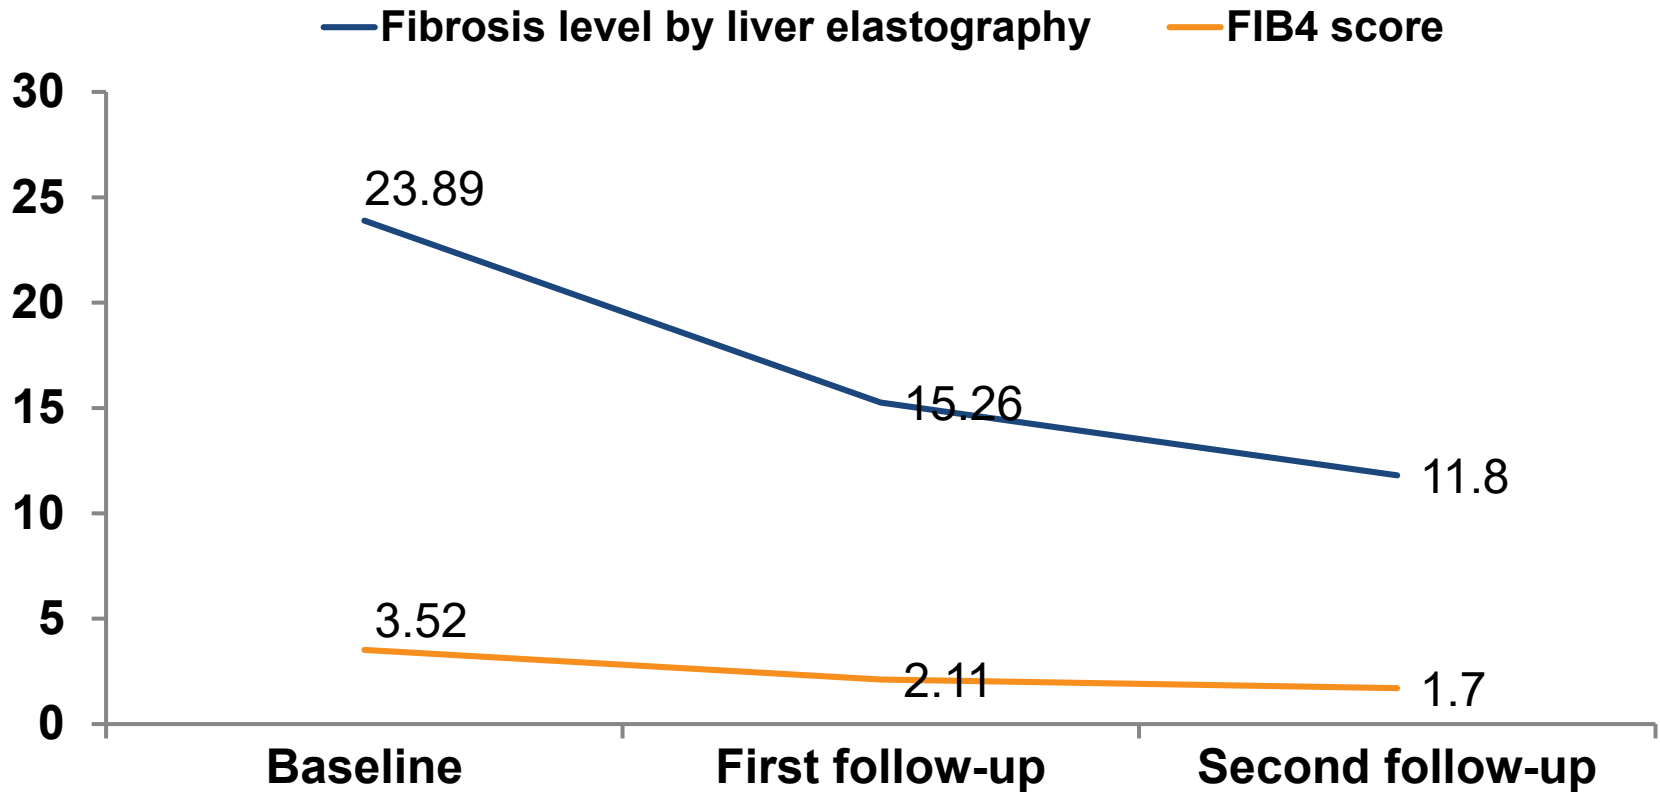

Results

Baseline clinical characteristics of the sample

Characteristic	Mean
FIB4 score	3.52
ALT	111.55 u/ml
AST	89.75 u/ml
HB	14.79 g/dL
PLTs	159 10 ⁹ /L
Spleen size	136X56 mm

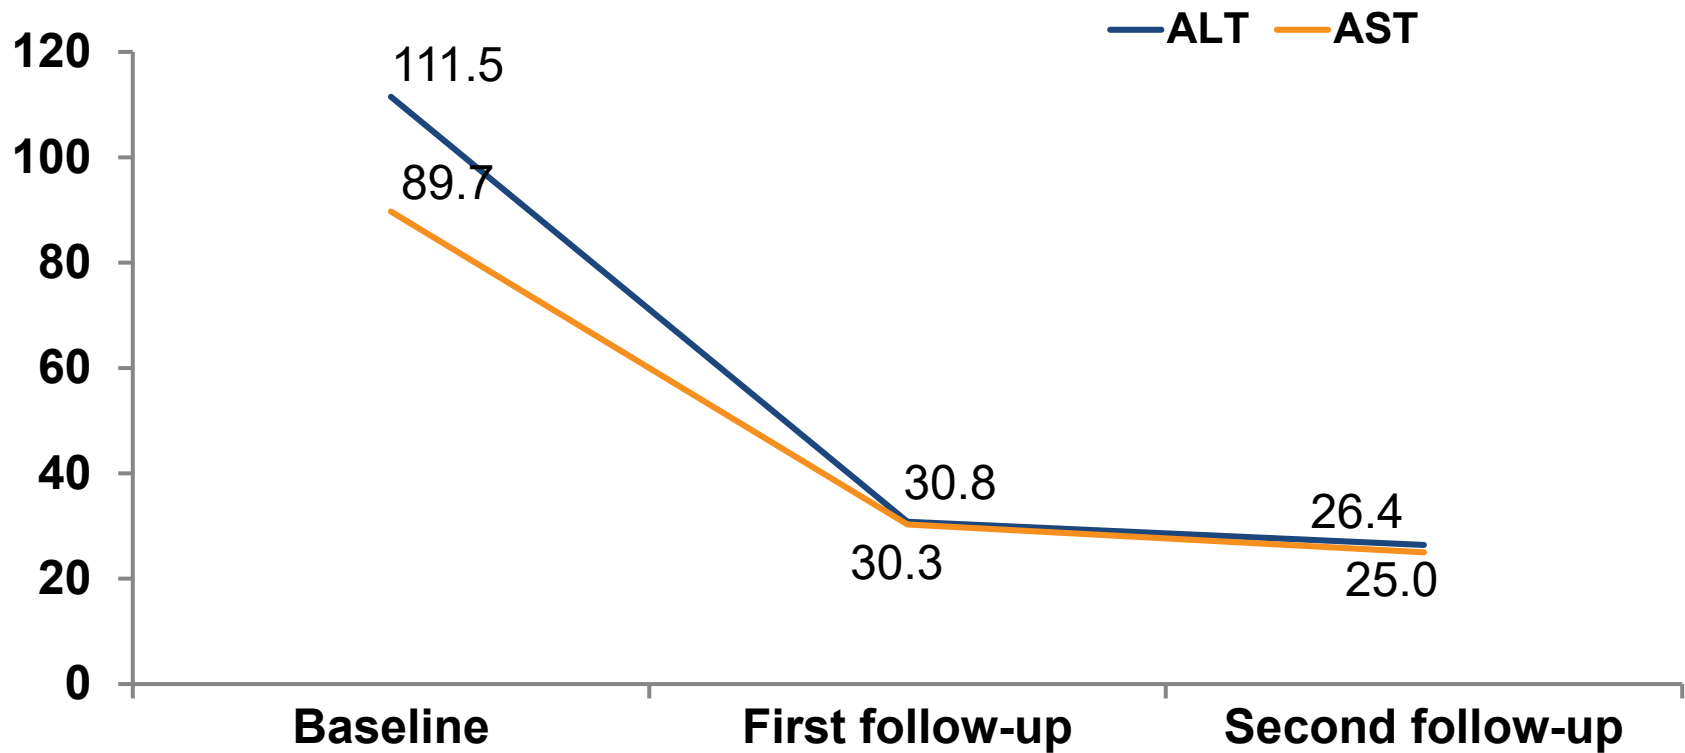

Results

Changes in mean liver fibrosis level

Results

Changes in mean serum ALT and AST levels

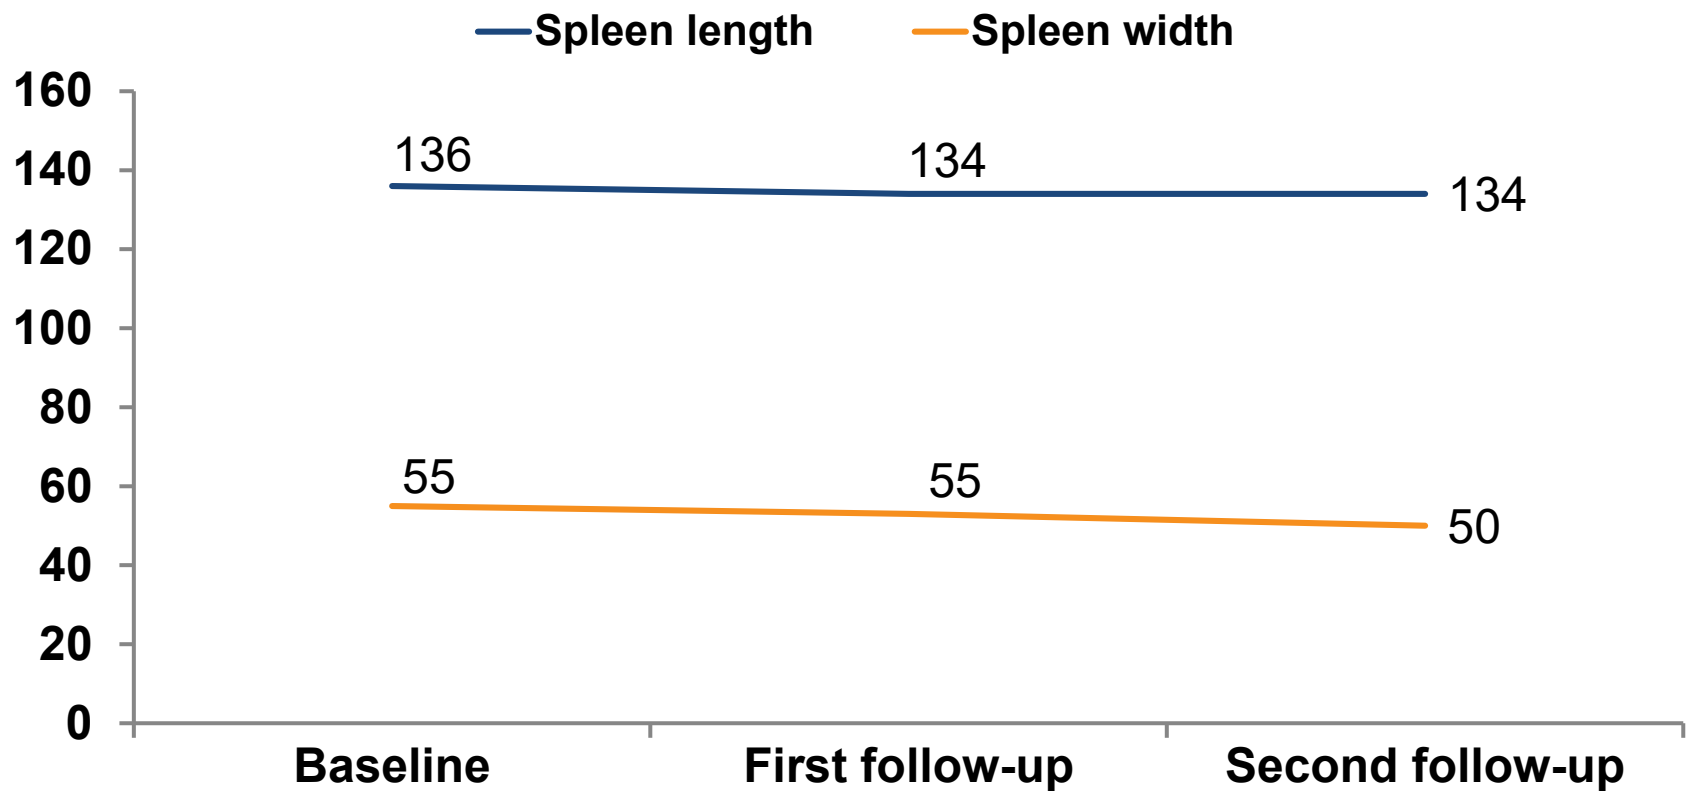

Results

Changes in mean PLT count and HB level

Results

Changes in mean spleen size

Results

First follow-up
(out of 600 patients)

**Patients with
ascites N=17**

**10 (58.8%)
resolved**

**Patients
without
ascites N=583**

**9 (1.5%)
developed
ascites**

Second follow-up
(out of 227 patients)

**Patients with
ascites N=5**

**3 (60%)
resolved**

**Patients
without
ascites N=222**

**2 (0.9%)
developed
ascites**

Results

- Out of 588 patients without focal liver lesions (FLL) at baseline 15 individuals (2.5%) developed unspecified FLLs suspected for HCC at first follow-up visit
- 6 (0.9%) deaths were reported at first follow-up visit by patients' families (not validated from death registry)

Conclusion

- Significant improvement in liver fibrosis level and different clinical and laboratory measures was observed 4 years after achieving SVR among patients with advanced liver fibrosis treated with DAAs through HCV elimination program.
